EXPERIENCE

CoverPin

May 2025 – Present

Software Engineer (Full Stack)

San Francisco Bay Area, Remote

- Designed and implemented a complete **Role-Based Access Control (RBAC)** backend system to enforce workspace-level resource restrictions; strengthened enterprise readiness, accelerated deal closures, and supported large-scale onboarding of customers with hundreds of entities and locations.
- Designed a **stack based data structure** that leverages **React Context** API to manage sequential modal components in a React app. It provides a mechanism to simplify complex, multi-step user interaction flows using modals.
- Designed an AI-powered chat app around CoverPin's business logic. The chat FE acts as a client-side state machine that drives the **multi-turn tool-call** loop. The backend is a **NestJS injectable** service that drives the chat, wrapping **OpenAI's Responses API** and persists conversation state in a relational database.
- Led end-to-end development** of a scalable License Management module using Next.js, NestJS, and PostgreSQL, enabling customers to create business licenses, manage license versions, and map them to entities and locations; directly contributed to onboarding new customers onto the platform.
- Architected and shipped a **Locations module** allowing companies to register operational locations critical for determining applicable federal, state, and local regulations; onboarded hundreds of locations and generated new revenue streams.
- Took full ownership of feature lifecycle, from **database schema design** to deployment while building and revamping reusable UI components to ensure consistency, scalability, and maintainability across the platform.

Pepper Content

June 2022 – April 2025

SDE1

Mumbai, Remote

- Revamped the **creator onboarding journey**. First by reducing friction by minimizing steps and implementing structured data collection; improved user experience while standardizing backend data models. Then built a **KYC verification workflow** collecting bank, GST, and Aadhaar details to ensure regulatory compliance and prevent payouts to mismatched bank accounts, reducing operational and legal risk.
- Owned and maintained the internal operations platform, proactively resolving production issues and delivering new feature enhancements to improve operational efficiency. Improved overall code quality by refactoring legacy components, reducing technical debt, and enforcing best practices.

INTERNSHIPS

Google Summer of Code 2021

Summer 2021

Student Developer

Remote

- Contributed to **PyData/Sparse** under the aegis of the Python Software Foundation, working on a library positioned to become the de-facto sparse array implementation in the Python ecosystem, replacing `scipy.sparse`.
- Designed and implemented from scratch an **ndarray-compatible Python API**, enabling seamless integration with NumPy-like workflows.

Voosh

2022

Software Engineering Intern

Bangalore, Remote

- Developed new reusable UI components
- Helped in migration of legacy data from **MongoDB** to a structured data warehouse on **GCP BigQuery**, improving data reliability and analytics capability.

EDUCATION

Jadavpur University

2018-2022

Bachelor's in Engineering

Kolkata, WB

SKILLS

Technologies : Typescript, JavaScript, Nestjs, Reactjs, Nextjs, Node, Express, HTML/CSS, SQL (PostgreSQL, MySQL), Python, Java, Golang, MongoDB

Tools : Docker, Figma, Notion, Jira, Git, GitHub, Linear
